STEP 03 | Current-State Analysis & Requirements

Translate observed support challenges into clear, testable requirements.

1. Analyze the current workflow

- Map ticket intake, validation, triage, assignment, response, escalation, resolution, and closure.
- Identify where tickets wait and where manual review or repeated entry occurs.
- Compare the handling of similar cases to find inconsistent priority decisions.
- Review how queues, agent skills, and capacity are currently managed.

2. Business requirements

- BR-01: Manage tickets as Salesforce Cases with status, owner, priority, and history.
- BR-02: Analyze ticket descriptions and context to recommend urgency and priority.
- BR-03: Assign cases to an appropriate agent or queue according to approved routing rules.
- BR-04: Apply explicit SLA and critical-incident rules for escalation.
- BR-05: Provide managers with reports on status, priority, SLA risk, and workload.
- BR-06: Make priority and routing outcomes reviewable and traceable.
- BR-07: Allow authorized users to override priority or assignment.
- BR-08: Measure operating performance and AI recommendation quality.

3. Example acceptance criteria

- An eligible new Case is triaged after creation without blocking case save.
- The result is either a priority recommendation or a review-needed flag.
- Explicit critical rules take precedence over conflicting AI recommendations.
- No eligible agent results in a safe fallback queue.
- Authorized manual changes are recorded in the appropriate history/audit fields.
- Managers can filter reports by date, queue, owner, status, and priority.
- AI or Flow failure does not cause a case to be lost.

4. Prioritization of requirements

- Must-have: case handling, triage, routing, critical escalation, access controls, and basic dashboards.
- Should-have: explainable routing reasons, confidence/review state, and advanced performance reporting.
- Later enhancement: model calibration, richer skill-based routing, and trend-based capacity planning.

5. Requirements traceability

- Assign each requirement an ID.
- Link each requirement to a design component, test case, and acceptance result.
- Obtain stakeholder approval before building features that affect priority or assignment.

Project note: This is a proposed implementation guide. Validate Salesforce features, licensing, configuration, security requirements, and business policies in the target organization before implementation.
