STEP 06 | Salesforce Data Model & Case Fields

Plan the minimum useful Case fields and supporting configuration.

1. Use the standard Case object first

- Prefer standard Salesforce Case fields when they meet the requirement: Case Number, Subject, Description, Status, Priority, Owner, Origin, Account/Contact, and Created Date.
- Create custom fields only when required for routing, AI review, audit, SLA reporting, or operational metrics.
- Confirm field types, picklist values, field-level security, and reporting needs before configuration.

2. Suggested custom field groups

- Classification: Issue Category, Product/Service, Customer Impact, Affected Users, Language.
- AI triage: AI Recommended Priority, AI Summary, Urgency Signals, Review Required, Analysis Timestamp.
- Assignment: Routing Reason, Assigned Queue/Team, Skill Requirement, Reassignment Count.
- SLA/performance: First Response Timestamp, Resolution Timestamp, SLA Target, SLA Risk Flag, Escalation Status.

3. Data quality rules

- Require enough intake detail for triage where practical.
- Define defaults for missing category or product values.
- Avoid storing sensitive AI prompt content or unnecessary duplicate summaries.
- Normalize picklist values and define who owns each field.
- Protect fields that should only be editable by managers or automation.

4. Example field inventory

- Case Priority: standard picklist; final policy-approved priority.
- AI Recommended Priority: custom picklist; model/AI suggestion only.
- AI Review Required: checkbox; true when uncertain or policy requires human review.
- AI Summary: short text area; compact issue summary for agent convenience.
- Routing Reason: text/picklist; concise reason for queue or agent selection.
- AI Analysis Timestamp: date/time; when the analysis completed.
- SLA Risk Flag: checkbox or derived value; should follow approved SLA logic.

5. Design caution

- Do not assume a particular AI confidence score is available. Use it only if the chosen Salesforce capability exposes a supported, meaningful score; otherwise use explicit review conditions.

Project note: This is a proposed implementation guide. Validate Salesforce features, licensing, configuration, security requirements, and business policies in the target organization before implementation.
