STEP 07 | System Architecture & Component Design

Describe how Salesforce components work together and keep AI interpretation separate from policy enforcement.

---

1. Architecture layers

- Experience/intake: Service Console and existing case intake channels.
- Core record: Salesforce Case and approved custom fields.
- Orchestration: record-triggered Flow and asynchronous paths where needed.
- AI interpretation: Agentforce or another supported Salesforce AI capability.
- Policy/routing: Flow decisions, queues, assignment rules, and Omni-Channel/skills routing where licensed and configured.
- Monitoring: reports, dashboards, notifications, history, and error tracking.
- Governance: permissions, sharing, field-level security, and AI controls.

2. High-level sequence

- Customer or agent creates a Case.
- Flow validates and enriches the Case.
- AI analyzes approved text and context.
- Flow validates the structured output and applies priority policy.
- Routing selects a qualified agent or queue.
- Notifications and timestamps support follow-up and SLA monitoring.
- Dashboards and human feedback support ongoing improvement.

3. Design principles

- AI interprets unstructured text; deterministic rules enforce business policy.
- Case creation should not fail just because AI is unavailable.
- Use a default queue and a clear error/retry policy.
- Prevent duplicate processing and automation loops.
- Make important routing decisions traceable.
- Use least-privilege access and minimize data sent for analysis.

4. Salesforce capability checks

- Confirm Service Cloud and Agentforce availability in the target org.
- Verify the chosen AI feature can be invoked from the intended Flow/action.
- Confirm routing requirements and licenses for queues, Omni-Channel, and skills-based routing.
- Validate limits, permissions, and sandbox testing options against current Salesforce documentation.

5. Architecture deliverables

- Component diagram.
- Sequence/workflow diagram.
- Field mapping and data flow.
- Error and fallback design.
- Security and permissions matrix.

Project note: This is a proposed implementation guide. Validate Salesforce features, licensing, configuration, security requirements, and business policies in the target organization before implementation.
