STEP 11 | Deployment, Training & Operations

Roll out safely, prepare support users, and establish ownership for ongoing monitoring.

1. Deployment sequence

- Complete development and unit/functional tests in a sandbox.
- Obtain stakeholder, security, and business sign-off.
- Deploy configuration using the organization's approved Salesforce release process.
- Validate permissions, queues, Flow activation, AI access, and dashboards in the target environment.
- Run smoke tests using controlled cases.
- Enable the feature for a pilot queue before wider rollout.

2. Pilot plan

- Choose a representative team or queue.
- Keep human review for uncertain or high-impact cases.
- Compare performance to baseline metrics.
- Collect agent feedback on priority accuracy, routing fit, and explanation usefulness.
- Fix defects and adjust rules before expanding.

3. Training topics

- How AI recommendations are generated and what they do not guarantee.
- How to review, override, and reassign cases.
- How critical incidents and fallback queues work.
- How to report incorrect priority or routing.
- How to handle sensitive data and avoid copying unnecessary details into free-text fields.

4. Operational ownership

- Name an owner for priority policy and escalation rules.
- Name an owner for agent skills and queue configuration.
- Name an owner for AI prompt/action changes and quality review.
- Name an owner for dashboards, errors, and incident response.
- Maintain a documented rollback plan.

5. Ongoing monitoring

- Review high-priority cases and false-low errors.
- Monitor Flow faults, AI failures, queue backlog, and reassignments.
- Review model/prompt changes before production release.
- Re-test after changes to priority rules, fields, channels, or Salesforce configuration.
